AB Chemiluminescent acridinium ester derivs. have been synthesized and
covalently attached to suitably modified synthetic DNA oligonucleotides.
Attachment of acridinium ester label to primary aliph. amine group(s)
present in the synthetic DNA probe mol. is rapid and efficient. Methods
have been developed for efficient sepn. of acridinium ester-labeled
DNA from unincorporated labeling reagent and
underivatized DNA. The basic hydrogen peroxide detection
reaction and photon counting conditions for measurement of
chemiluminescence emission from acridinium ester-labeled DNA probes have
been optimized. Under optimal conditions, the obsd. detection limit for
the labeled DNA (1:1 mol ratio) is the same as for the free acridinium
ester label, which is 2 amol sensitivity in the best case studied.

AB. . . [ArNHC(O)CH₂Cl] and [14C-phenyl]2,6-diethylaniline (DEA) (ArNH₂),
and to [14C-methoxy]alachlor in various in vitro and in vivo systems.
Horseradish peroxidase and hydrogen peroxide activate DEA, but
not CDEPA or alachlor, for formation of adducts with calf thymus DNA,
which probably involves 2,6-diethylnitrosobenzene (ArNO). . . each
labeled preparation to calf thymus DNA; 4-fold higher labeling is observed
from [14C-methoxy]- than from [14C-phenyl]alachlor. This 4-fold
preferential DNA labeling from the 14C-methoxy
compound is likewise found in the liver of mice treated intraperitoneally.
Mouse liver protein and hemoglobin are also labeled, in vivo, with
[14C-phenyl]alachlor, -CDEPA and -DEA, and as with the DNA, the
labeling of these proteins is 1.5- to 2-fold higher with
[14C-methoxy]alachlor. Metabolic studies indicate that
ArN(CH₂OCH₂OH)-C-(O)CH₂Cl is an intermediate in forming. . .

TI Redox polymerization diagnostic test composition and method for
immunoassay and nucleic acid hybridization assay

AB A diagnostic test compn. for detecting and measuring an analyte possessing
biol. activity comprises (a) a redox catalyst system capable of converting
a monomer to a polymer, the monomer capable of undergoing addn. polymn.,
the redox catalyst system comprising .gtoreq.1 chem. moieties with 1) the
analyte comprising .gtoreq.1 such moiety or 2) in the case that the
analyte lacks a redox catalyst property, the analyte is linked by a
specific ligand to .gtoreq.1 such moiety or is linked by the specific
ligand to a generator of .gtoreq.1 such moiety; and; (b) .gtoreq.1 monomer
capable or undergoing addn. polymn. Immunoassays and nucleic
acid hybridization assays using redox polymn. are described. Thus,
glucose oxidase coupled to antibody is reacted with an immobilized antigen
spot on a glass slide, uncombined conjugate is washed off, and the slide
is dipped into a soln. contg. Ca acrylate 10%, glucose 5%, and ascorbate
acid 0.5% for 10 min to form a grossly visible white ppt. at the site of
the antigen.

ST redox polymn diagnosis test signal; immunoassay redox polymn;
nucleic acid hybridization redox polymn

IT Diagnosis

(immunoassay or nucleic acid hybridization assay compn. for,
redox polymn. signal in)
